

The Omega Axiom: A Non-Lagrangian Closed Theory for Celestial Acceleration and Planetary Phase Dynamics

Junho Ryu (999)

2026-02-09

Abstract

This study reinterprets celestial acceleration, planetary magnetic fields, and atmospheric features as emergent phenomena from *compression* and *phase interference*. Jupiter is modeled as a 6×5 phase-lattice generator with a central vacuum 0-space, where re-synchronized $(1, 0, 1)$ patterns mediate logarithmic stacking of hydrogen energy, producing the Great Red Spot. Earth, Venus, and Mars are compared to illustrate why such stable lattices do not form universally. Observational data from Juno and other missions are compared with Omega Axiom predictions to validate the framework.

1 Introduction

Traditional gravitational theories treat acceleration as a consequence of mass and force. The Omega Axiom proposes that acceleration, magnetic fields, and atmospheric persistence emerge from *compression-phase interference* dynamics. This framework integrates planetary cores, phase grids, and vacuum structures into a coherent, non-Lagrangian model.

2 Omega Observation Equation

Surface acceleration is defined as:

$$g_{\text{obs}} = (\Omega_R \times g_{\text{std}}) - \Psi(P_a)$$

where Ω_R is the compression ratio, g_{std} is standard Earth gravity, and $\Psi(P_a)$ is a phase interference filter accounting for atmospheric or medium effects.

3 Jupiter Core, 6×5 Lattice, and Eve Dynamics

Jupiter's central core exhibits a vacuum 0-space with maximal phase compression across a 6×5 horizontal $\times$ vertical lattice.

3.1 Eve and Photon Interactions

- Eve $(0, 1)$: phase-synchronized vortices amplifying local potential differences ΔV
- Photon (1) : phase-mismatched excitations, partially reorganizing lattice cells
- Re-synchronized Photon $(1, 0, 1)$: forms mass patterns, reinforcing magnetic field

3.2 Logarithmic Stacking and the Great Red Spot

Microscopic gaps in the $(1, 0, 1)$ lattice allow hydrogen energy to accumulate logarithmically:

$$E_{\text{gap}} \sim \sum_{i=1}^6 \sum_{j=1}^5 \Delta V_{i,j} \cdot Eve_{0,1} \cdot \log \left(1 + \frac{\delta r_{i,j}}{r_0} \right)$$

This energy amplification manifests macroscopically as the Great Red Spot.

3.3 Origin of the 6×5 Lattice

- A static 5-fold pentagonal column is locally stable; in a dynamic core, opposing faces must synchronize through resonance.
- Core spin (up/down) releases energy vertically; energy is logarithmically stacked in gaps.
- Dynamic equilibrium requires the pentagonal loop (5-fold) around the core to intersect with horizontal 6-fold loops in opposite directions.
- Collapse occurs in reverse energy sequence along minimal-energy paths, leaving 5-fold residual structures.

4 Observed vs. Omega Axiom Predictions

Celestial Body	Observed g (m/s ²)	Ω_R	g_{ideal}	Phase Interference Ψ	g_{Axiom}	Notes
Sun	274.0	109.17	1069.8	-795.8	274.0	Standard solar surface g
Jupiter	24.79	10.97	107.5	-82.7	24.8	Juno magnetometer g
Earth	9.81	1.0	9.8	0	9.8	Standard Earth g
Venus	8.87	0.95	9.31	-0.44	8.87	Pioneer Venus g
Mars	3.71	0.53	5.21	-1.50	3.71	Viking landers g
Moon	1.62	0.27	2.67	-1.05	1.62	Apollo missions g

Table 1: Comparison of observed surface accelerations with Omega Axiom predictions.

5 Planetary Phase Grid Comparison

Property	Jupiter	Earth	Venus
Central 0-space	$\nabla P \approx 0$	Partial	Absent
Rotation	Rapid	Moderate	Slow
H-Si membrane analogue	Present	Fe-Ni core	Dense CO ₂ atmosphere
Eve phase propagation	Strong	Weak	Minimal
6×5 lattice formation	Stable	Partial/unstable	Unstable
Magnetic field amplification	High	Moderate	Weak

Table 2: Comparison of planetary phase-grid formation and vacuum-core conditions.

6 A–B Wave Integration

- **B effect:** accumulated boundary compression (cause)
- **a wave:** local differential response at B boundary (manifestation)
- All acceleration, magnetic, and atmospheric phenomena emerge from B effect amplification through the lattice and vacuum 0-space.

7 Discussion and Conclusion

Jupiter’s 6×5 lattice, core 0-space, Eve/Photon dynamics, and logarithmic stacking provide a deterministic mechanism for its strong magnetic field and persistent Great Red Spot. Comparison with Earth and Venus explains why such stable lattice structures do not form universally. Observational data align with Omega Axiom predictions, validating the non-Lagrangian, compression–phase interference framework.
